PUJITH M

Senior Software Engineer | Web3 Enthusiast

+919741283118 PujithCareerVenture@gmail.com
https://linkedin.com/in/pujith-m Bengaluru, India

SUMMARY

Experienced Senior Software Engineer with a strong background in designing and building scalable, resilient backend systems. Skilled in Golang, TypeScript, Kafka, and distributed architectures, with expertise in high-throughput APIs, event-driven systems, and performance optimization.

PROFESSIONAL EXPERIENCE

Senior Software Engineer — 05/2025 - Present

Careem — Remote

A leading ride-hailing and super app in the Middle East, acquired by Uber, offering rides, food delivery, and digital payments.

- Working in the **Rides team** on the **integration of Hala** (Dubai's taxi e-hailing service) into Careem's ride-hailing platform, ensuring seamless booking and payment experiences.
- Led the implementation of an **ETA-based product switch**, enabling smooth migration from the legacy Hala system to the new Hala marketplace, reducing downtime and improving reliability.
- Collaborating with cross-functional teams across **backend, mobile, and product** to ensure scalable and fault-tolerant ride services in high-demand markets.

Senior Software Engineer — 04/2021 - 05/2025

Unmarshal — Bengaluru, India

A multi-chain data infrastructure company that provides seamless access to blockchain data for **Wallets**, **DeFi**, and **NFTs**.

- Designed and built a **high-performance blockchain data indexing solution** handling 500M+ API requests per month, improving scalability and reliability with **Golang**, **LevelDB**, **DynamoDB**, and **Kafka**.
- Led a team of **five engineers**, providing **technical guidance, code reviews, and mentorship**, fostering a high-performance culture in blockchain indexing and microservices.
- Developed **developer tools and explorers** including **Unmarshal Parser**, **Xscan**, and **SDKs**, reducing integration time by **50%** and improving data retrieval speed by **30%** for 50K+ monthly users.
- Built a **real-time Web3 notification engine** delivering 50M+ monthly notifications on blockchain events, optimized for performance and reliability.
- Led the development of Xscan, a cross-chain blockchain explorer, increasing blockchain data retrieval speed by **30%** and serving **50K+ monthly users**.
- Implemented an **API gateway** processing **20M+ requests daily**, enhancing authentication security and cutting unauthorized access by 60%.
- Managed and optimized Unmarshal's infrastructure using **Docker**, **Kubernetes**, and **Helm** to streamline CI/CD workflows. Set up centralized **logging** and **monitoring** with **Grafana**, **Loki**, and **Prometheus**, boosting observability and cutting **MTTR by 50%**.

Software Development Engineer II — 12/2019 - 03/2021

Navi Technologies Pvt Ltd — Bengaluru, India

A digital financial services company that leverages technology to simplify lending and personal finance solutions.

- Built and maintained core **accounting systems** ensuring **compliance** with financial regulations, including timely **CIBIL reporting**, using Spring Boot, **Kafka**, and **Postgres**.
- Developed a **rule-based** automated loan collection system that boosted **efficiency** by **15%** through repayment reminders and streamlined customer management.

Associate Developer — 07/2018 - 11/2019

MavenHive Technologies — Bengaluru, India

A Bangalore-based consulting firm that accelerates early-stage startups by transform innovative ideas into market-ready products, later acquired by Navi.

- Contributed to early-stage product development for clients like **CRED** and **CultFit**, building dashboards and e-commerce systems.

SKILLS

Programming Languages

Golang, Typescript, Java, Solidity

Backend & Frameworks

Node.js, Spring Boot, Kafka, Kubernetes, Docker, AWS, GCP

Databases & Caching

Postgres, Redis, DynamoDB, LevelDB

Blockchain & Web3

Web3.js, Foundry, Geth, RPC

Frontend

React.js, Next.js, MUI, Tailwind

EDUCATION

Bachelor of Engineering in Computer Science

SJB INSTITUTE OF TECHNOLOGY

2014 - 2018 — Bengaluru, India

KEY ACHIEVEMENTS

Developed a Consensus Mechanism for Token Balances

Designed a system to ensure atomicity and 100% accurate token balances. Shifted from fetching balances on demand to real-time tracking, reducing node calls by 70% and significantly lowering operational costs.

Modularized Blockchain Indexers for Non-EVM Chains

Implemented a modular indexing framework using Go generics and well-defined interfaces. This reduced development time for new chain integrations by 60-70%, streamlining blockchain data processing.

Optimized Data Storage in LevelDB

Transitioned data storage from JSON to ProtoBuf, improving performance, reducing storage usage by 30%, and cutting costs.

Technical Hiring, Mentorship, and Training

Led the hiring and onboarding of freshers, mentoring them in Agile methodologies, writing high-quality code, and structured software development practices to build a strong engineering culture.
